

How to generate your own **mockups** with **AI**

A practical toolkit: which AI tools to use for logos, app screens and icons, plus copy-paste prompts tuned to Genauly and the Cobalt / Butter / Coral palette. Generate, pick what you love, hand it back to be built into the real app.

Cobalt 2B4FE0	Butter FFC24D	Coral FF6B54	Sky CBD8FF	Ink 111318	Cream F3F0E7
-------------------------	-------------------------	------------------------	----------------------	----------------------	------------------------

What's inside

- 1 · The brief (paste this into any tool first)
- 2 · Palette & type reference
- 3 · Which tool for which job
- 4 · Prompts: logo & app icon
- 5 · Prompts: app screens
- 6 · Prompts: icon set & moodboard
- 7 · Restyle your real screenshots
- 8 · Pro tips & settings
- 9 · Handing results back to build

How to use this: start with the tool table (section 3), pick a tool for the job you want, then copy the matching prompt from sections 4–7. Always paste **the brief (section 1)** first so the tool has the context and the exact colors. Generate 4–6 variations, keep what you love, then see section 9 to hand it back.

1 · The brief

Paste this block at the top of any chat-based tool (ChatGPT, Gemini, v0) or use it as the description in an image tool. It carries the product, the feeling, the exact palette, and the hard rules.

MASTER BRIEF · PASTE FIRST

Genauly is a mobile-first web app that helps adults break through the B1–B2 German "plateau" and build real-life fluency for the workplace and everyday admin (Behörde, bank, doctor, housing), plus exam prep (telc B2 Beruf, Goethe B2). Audience: adults 25–45 learning German as immigrants and professionals.

Brand feeling: encouraging, modern, precise, a little playful. Confident but warm. NOT childish, NOT corporate-SaaS, NOT a generic language-app mascot.

Design language:

- FLAT color. NO gradients anywhere (not on the logo, not on buttons, not on backgrounds).
- Bold and colorful, with crisp rounded shapes and generous spacing.
- Solid-color fills, clean 2px line icons, strong type hierarchy.

Exact palette (use only these):

- Cobalt #2B4FE0 primary / brand / buttons
- Butter #FFC24D warm highlight
- Coral #FF6B54 playful accent
- Sky #CBD8FF soft fill / chips
- Ink #111318 text
- Cream #F3F0E7 background

(Keep a success-green and error-red only for status, used sparingly.)

Avoid: gradients, glossy 3D, bevels/embossing, drop-shadow skeuomorphism, generic SaaS purple, a rounded-square gradient "G" that looks like the Canva logo, stock blobs, neon cyberpunk, lorem ipsum text.

The name comes from **genau** ("exactly"). If you want the mark to say something, precision / exactness / "the click of getting it right" is the core idea. A German **umlaut** (two dots) is a distinctive, ownable device if you want to lean German.

2 · Palette & type reference

ROLE	NAME	HEX	NOTES
Primary / buttons	Cobalt	#2B4FE0	The one dominant brand color. Solid fills only.
Warm highlight	Butter	#FFC24D	Streaks, rewards, a warm secondary. Ink text on top.
Playful accent	Coral	#FF6B54	Optional fun pop for badges/tags. Use sparingly.
Soft fill	Sky	#CBD8FF	Chip backgrounds, quiet surfaces, level tags.
Text	Ink	#111318	Near-black with a blue bias.

Background

Cream

#F3F0E7

Warm off-white ground (or keep a cool white if preferred).

Type pairings to try (all free / licensable)

- **Clash Display** (headings) + **Inter** (body) — geometric, characterful, modern.
- **Space Grotesk** (headings) + **Inter** — techy-precise, friendly.
- **Fraunces** (headings, "soft serif") + **Inter** — warmer, editorial.
- **Geist** (Vercel) for a clean all-in-one sans.

The app currently ships Inter. Keeping Inter for body and adding one display face for headings/logo is the lowest-friction upgrade.

3 · Which tool for which job

Pick by **what you want to make** and **what format you need back**. For a logo you want a vector (SVG); for an app screen a clean image or, better, editable UI or code.

JOB	BEST TOOLS	OUTPUT	COST
Logo & wordmark	Recraft, Ideogram, Midjourney, ChatGPT (image)	Recraft/Ideogram export SVG	freemium
App icon (the "G" tile)	Recraft, Ideogram, ChatGPT	PNG 1024 ² , SVG in Recraft	freemium
App screen mockups (as code)	v0.dev (React+Tailwind, matches our stack)	Live React/Tailwind code	freemium
App screen mockups (as UI)	Uizard, Galileo AI, Lovable, Bolt.new	Editable UI / app	freemium
Screenshot → editable UI	Figma + Visual Copilot (Builder.io), html.to.design	Editable Figma	freemium
Icon set	Recraft, Midjourney, ChatGPT	SVG (Recraft) / PNG	freemium
Moodboard / style	Midjourney, Krea, Leonardo	Image boards	MJ paid · Krea freemium
Recolor a screenshot	ChatGPT (GPT-4o), Gemini, Krea image-to-image	PNG	freemium

TOOL	LINK	WHY
v0.dev	v0.dev	Text→React+Tailwind UI. Output is close to our real stack , easiest to actually ship.
Recraft	recraft.ai	True vector/SVG output, brand-palette lock, great for logos + icon sets.
Ideogram	ideogram.ai	Best at rendering real text/letters correctly — ideal for the "Genaully" wordmark.
Midjourney	midjourney.com	Strongest style/aesthetic + moodboards. Raster only (concepts, not final vectors).
Uizard / Galileo	uizard.io · usegalileo.ai	Text→app-screen mockups, quick to explore whole flows.
ChatGPT / Gemini	chatgpt.com · gemini.google.com	Paste the brief + upload a screenshot to recolor or restyle conversationally.

Fastest path to something buildable: use **Recraft/Ideogram for the logo** and **v0.dev for one or two screens**. Both give me artifacts I can convert straight into the app (SVG + hex codes, or Tailwind classes).

4 · Prompts: logo & app icon

Run each in Recraft or Ideogram (both export vectors). For Midjourney, append the parameters shown. Generate 4–6, then iterate on your favourite with "same but...".

4a · Wordmark "Genauly"

RERAFT / IDEOGRAM

Flat vector logotype of the word "Genauly", lowercase geometric sans-serif, solid cobalt #2B4FE0 letters on a cream #F3F0E7 background, tight modern letter spacing, one small coral #FF6B54 dot as the only accent, high contrast, crisp edges, no gradient, no shadow, no icon, balanced and confident. German language-learning brand.

4b · Monogram / app icon (keep the "G")

RERAFT / IDEOGRAM

Flat app icon, single letter "G" in a bold geometric sans, centered on a solid cobalt #2B4FE0 rounded-square, white letter, NO gradient, NO bevel, NO inner shadow, completely flat, crisp, iOS app icon style, 1024x1024.

Then generate these variants: (1) butter #FFC24D square with ink #111318 G, (2) ink #111318 square with butter G, (3) coral #FF6B54 square with white G, (4) cream square with cobalt G and a thin cobalt border.

4c · Three concept directions (if you want the mark to mean something)

MIDJOURNEY / RERAFT

Concept A – PRECISION: minimal flat logo mark suggesting exactness, a crisp target notch or a level/alignment mark, cobalt + coral, flat vector, no gradient.

Concept B – UMLAUT: a letter "G" with two dots (umlaut) floating above it, the dots in cobalt and butter, playful-smart, unmistakably German, flat, no gradient.

Concept C – BREAKTHROUGH: an upward arrow or step breaking through a flat horizontal "plateau" line, cobalt with a coral tip, flat geometric, no gradient.

--no gradient, glossy, 3d, bevel, shadow, canva, photograph --ar 1:1 --style raw

Ask for a **logo lockup sheet**: "show the mark at large size, as a small favicon, in one color (all cobalt), and reversed (white on ink)." That reveals whether it survives at 16px.

4d · Ground-up logo rework (explore fresh marks)

Not tied to the current rounded-square "G". This asks for a **wide spread** of fresh directions in one go, so you can see the range before narrowing. Best in Recraft or Ideogram (vector, on-palette); use Midjourney to explore the feeling. Ask for a grid.

RERAFT / IDEOGRAM / MIDJOURNEY · EXPLORATION SET

Design a fresh brand logo for "Genauly", a German language-learning app for adults at the B1-B2 level. Explore a WIDE range of directions in one set. Flat and modern, solid colors only from this palette (cobalt #2B4FE0, butter #FFC24D, coral #FF6B54, ink #111318, cream #F3F0E7), no gradient. The name comes from "genau" = exactly / precise.

Give me distinct concepts, one per archetype:

1. WORDMARK only – a custom lowercase logotype of "Genauly" with one clever detail (a cut letter, a dot, an accent) and nothing else.
2. LETTERMARK – a reworked "G" that does NOT look like a rounded-square app tile.
3. UMLAUT device – two dots as the hero element, over the word or over a letter.
4. PRECISION symbol – a crisp checkmark, target, notch, or alignment/level mark.
5. BREAKTHROUGH – a step or arrow crossing a flat horizontal "plateau" line.
6. CONVERSATION – a minimal speech bubble hinting at speaking German.

For each concept show the symbol locked up with the "Genauly" wordmark, and the symbol alone. Flat vector, crisp, confident, ownable, distinctly NOT a Canva-style gradient square.
--ar 1:1 --style raw --no gradient, 3d, glossy, bevel, shadow, mascot, photograph

Then pick the strongest direction and turn it into a real system:

RERAFT / IDEOGRAM · REFINE THE WINNER

Take direction #[N]. Build a full logo system from it, perfectly flat, no gradient:

- Primary horizontal lockup: symbol + "Genauly".
- Stacked lockup (symbol above the word).
- Symbol-only app icon, 1024x1024, on one solid background color.
- One-color version (all ink #111318) and reversed (white on cobalt #2B4FE0).
- A 16px favicon crop to prove it still reads tiny.

Show everything on a cream #F3F0E7 background and again on a cobalt background. Keep proportions and spacing consistent across all lockups.

Get it back as vector. In Recraft/Ideogram export the winner as **SVG** (clean, recolorable, scales to any size). Midjourney is raster only, so use it to find the look, then rebuild the chosen mark in Recraft for a usable SVG. Auto-logo makers like **Looka** or **Brandmark** can also generate full lockup sheets if you'd rather start from a form and tweak.

5 · Prompts: app screens

Best in v0.dev (output is React + Tailwind, our stack). Paste the master brief first, then one screen prompt. Ask for a 390px-wide mobile frame.

5a · Praktisch (Dashboard / home)

V0.DEV

Design a 390px-wide mobile screen for Genauly. Flat, no gradients, palette as briefed (cobalt buttons, cream background, butter/coral accents, ink text). Layout, top to bottom:

- App bar: round logo tile left; a streak pill (flame + number) and a round avatar right.
- A segmented toggle with two options "Üben" and "Spielen", the active one on a white pill.
- A centered title "Lernpfad".
- A card holding a simple flat illustrated city map (a few rounded landmark tiles, a dotted route, a location pin labeled "Du bist hier").
- A mission card: a small "3 / 6" badge, a title "SIM-Karte kaufen", a subtitle, and one solid cobalt button "Jetzt üben" (flat, no gradient).
- A bottom tab bar with 4 flat line icons.

Rounded cards, crisp borders, generous spacing, playful but clean.

5b · Theorie (vocabulary library)

V0.DEV

Genauly mobile screen, flat, palette as briefed. A word-library browser:

- Top: 4 tabs "Wörter / Kollokationen / Redemittel / Grammatik", active tab in cobalt.
- A row of small view-switcher buttons and a filter + search icon.
- A scroll list of word cards. Each card: the German word bold, a der/die/das article chip color-coded (der = cobalt, die = coral, das = green), an example sentence in italics, small tag chips (a CEFR level on a sky #CBD8FF chip, a theme tag).
- A sticky bottom bar: a solid cobalt "Üben" button (flat) and a word count.

No gradients anywhere. Colorful, friendly, crisp.

5c · Study session (flashcard, full-screen)

V0.DEV

Genauly full-screen study card, flat, palette as briefed. A thin progress bar (solid cobalt, no gradient) with "Karte 8 / 13". A large centered card showing a German word, a pronunciation hint, and an English gloss. Below, four flat answer buttons in a row: "Nochmal" (coral outline), "Schwer", "Gut" (cobalt), "Leicht" (green), each with a small interval label. Calm, focused, lots of whitespace.

5d · Neuland game mission (optional, "pixel" style)

MIDJOURNEY / V0.DEV

A mobile game scene for a German learning RPG called Neuland. Flat 2D, bold outlines, retro-modern (not 8-bit noise). A shop counter scene, a shopkeeper NPC, a speech box at the bottom with a German line and two answer choices as flat buttons. HUD: a small "patience" bar top-left, a backpack icon top-right. Palette: cobalt UI, butter/coral accents, cream. No gradient.

6 · Prompts: icon set & moodboard

6a · Domain icon set

RECRAFT (SVG) / MIDJOURNEY

A set of 6 matching flat line icons on a 24px grid, 2px strokes, rounded joins, two-tone (cobalt #2B4FE0 with a coral #FF6B54 highlight), no gradient, consistent weight and style. The six: a meeting/handshake, a calendar appointment, a bank building, a doctor/stethoscope, a house, a government office (Amt). Simple, friendly, legible small.

6b · Style moodboard

MIDJOURNEY / KREA

Brand moodboard for a flat, colorful German learning app: solid cobalt, butter, coral and cream, bold geometric type, rounded flat UI cards, flat line icons, confident and friendly, editorial layout, lots of whitespace. No gradients, no 3D.

--ar 16:9 --style raw --no gradient, glossy, photograph

A moodboard first is a good way to lock the **feeling** before committing to a logo or screens. Save the one you like and paste it back as reference into the logo/screen tools.

7 • Restyle your real screenshots

If you want to keep your existing layouts and only explore **color**, feed a screenshot as reference. Best in ChatGPT (GPT-4o image), Gemini, or Krea (image-to-image). Upload the screenshot, then:

CHATGPT / GEMINI • WITH A SCREENSHOT ATTACHED

Here is a screenshot of my app screen. Recolor it to this flat palette, keeping the exact same layout, icons, spacing and text: cobalt #2B4FE0 for primary buttons and the active state, cream #F3F0E7 background, butter #FFC24D and coral #FF6B54 as accents, ink #111318 text, sky #CBD8FF for chips. Make all buttons a solid flat color (no gradient). Do not redesign anything, only change the colors. Return the same screen restyled.

Reality check: image tools will *redraw* the screen and often drift from your real layout (fonts, spacing). They're great for a **color vibe**, not pixel-accurate specs. For a pixel-accurate recolor of the real app, just tell me the hex codes you landed on and I'll apply them to the live app in minutes (that path is exact).

You can export fresh screenshots of any current screen to feed these tools; ask and I'll generate clean PNGs of any page (light or dark) for you to upload.

8 · Pro tips & settings

Sizes to request

- **App icon:** 1024 × 1024 px, square.
- **Wordmark:** wide, ~3:1 (e.g. 1800 × 600).
- **Mobile screen:** 390 × 844 (or 1290 × 2796 for @3x retina).
- **Moodboard:** 16:9.

Getting flat, on-brand results

- Always include the words "**flat, solid color, no gradient, no shadow, no bevel**". Models love gradients by default.
- Paste **exact hex codes** every time. Without them you'll get "close-ish" colors.
- In Midjourney add `--style raw` (less decorative) and a `--no gradient, 3d, glossy, canva` negative.
- In **Recraft**, set a **brand palette** and pick the "Flat illustration" / "Icon" style so every generation stays on-palette and exportable as SVG.
- Generate **4-6 variations**, choose one, then refine with "keep everything, change only X".

Keeping your layout

- For screens you designed, upload a **screenshot as a reference/structure image** and say "match this layout".
- Or skip the redraw entirely: choose colors here, and I apply them to the real app so nothing about your layout changes.

Avoiding the "AI look"

- No generic SaaS purple, no glowing gradients, no 3D blobs, no mascot unless you want one.
- One dominant color (cobalt) + one or two accents beats a rainbow. Let whitespace do work.

9 · Handing results back to build

Once you've generated things you love, give me the following and I'll implement it in the real app (tokens, logo assets, favicons, PWA icons), no redesign of your layouts:

- **Final palette:** the hex codes you settled on (even if they differ from this guide).
- **Logo:** the chosen mark as **SVG** if possible (Recraft/Ideogram export it), otherwise a high-res PNG, plus which color combo for the small favicon.
- **Screens:** either the image you like (as a visual target) **or** the v0.dev link / code — code is ideal because I can adapt it directly.
- **Type:** the display font name if you picked one.

The exact, reversible path: the app's colors live in a few design-token variables (`src/index.css` + `tailwind.config.ts`, light + dark). Once you give me final hex codes and a logo, I wire them in, regenerate the logo / favicons / PWA icons, run the build, and show

you the real app. Everything stays flat and gradient-free, and every screen re-themes at once.

Genauly · AI mockup generation guide · v1. Regenerate this PDF from [docs/branding/genauly-ai-mockup-guide.html](#).
